

README

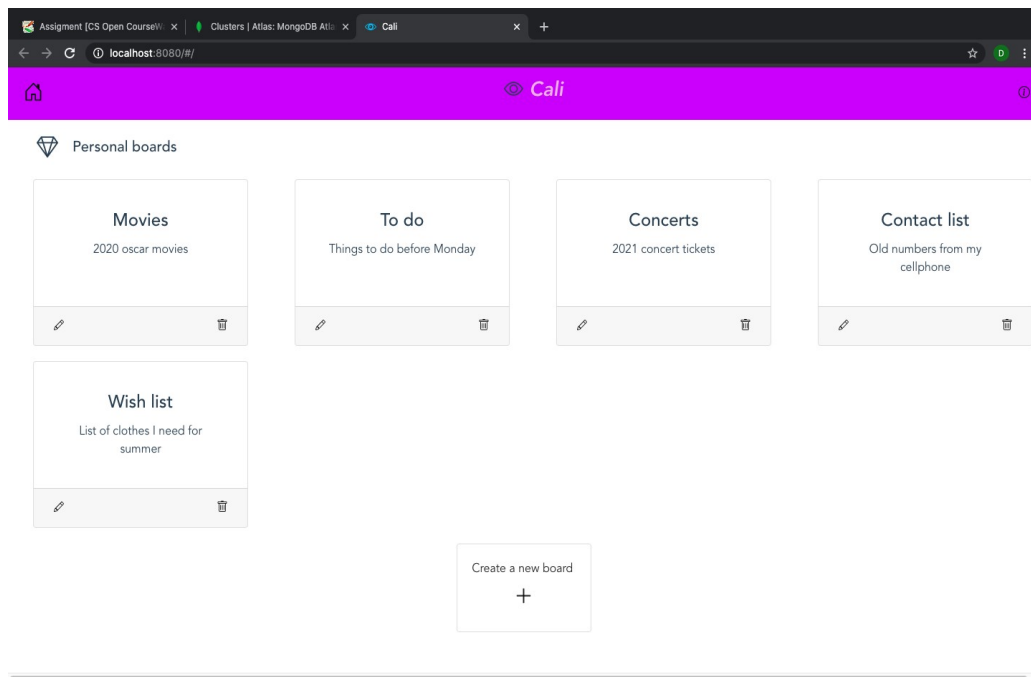

Mihailov Doina

How do you start the app?

npm install (in the backend folder)
npm install (in the todo-list folder)
npm rebuild node-sass (in the todo-list folder)
npm run dev (in the todo-list folder)

How does the app work?

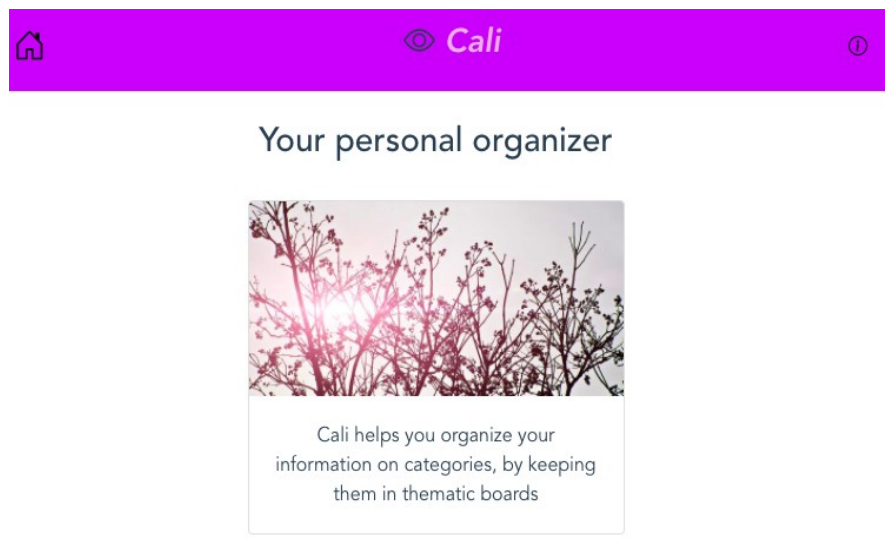

The app opens with the view that shows us the boards.

The home button will always redirect us to this page.

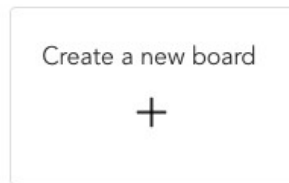

The info button will redirect us to a page that stores some information about the app.

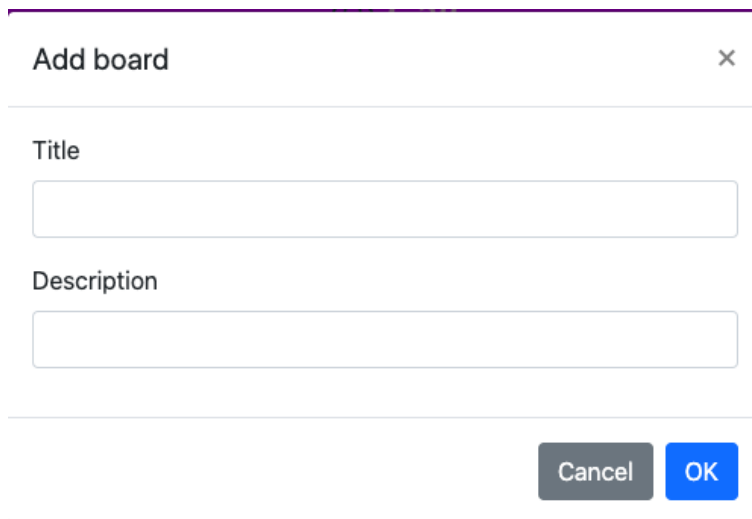

The Boards

A new board can be created by clicking on the “create new board button”.

A new modal will appear with a form. The user needs to introduce the title and the description for the new board. The title is required.

A modal window titled "Add board" with a close button (X) in the top right corner. It contains two text input fields: "Title" and "Description". At the bottom right, there are two buttons: "Cancel" (gray) and "OK" (blue).

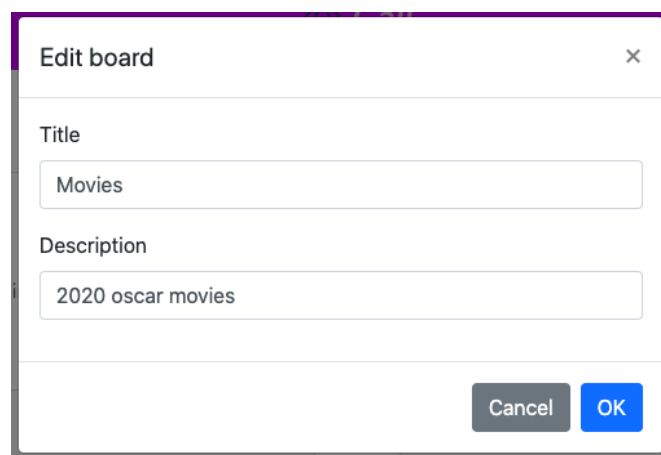

A board can be removed by clicking on the erase button.

And can be edited by clicking on the edit button.

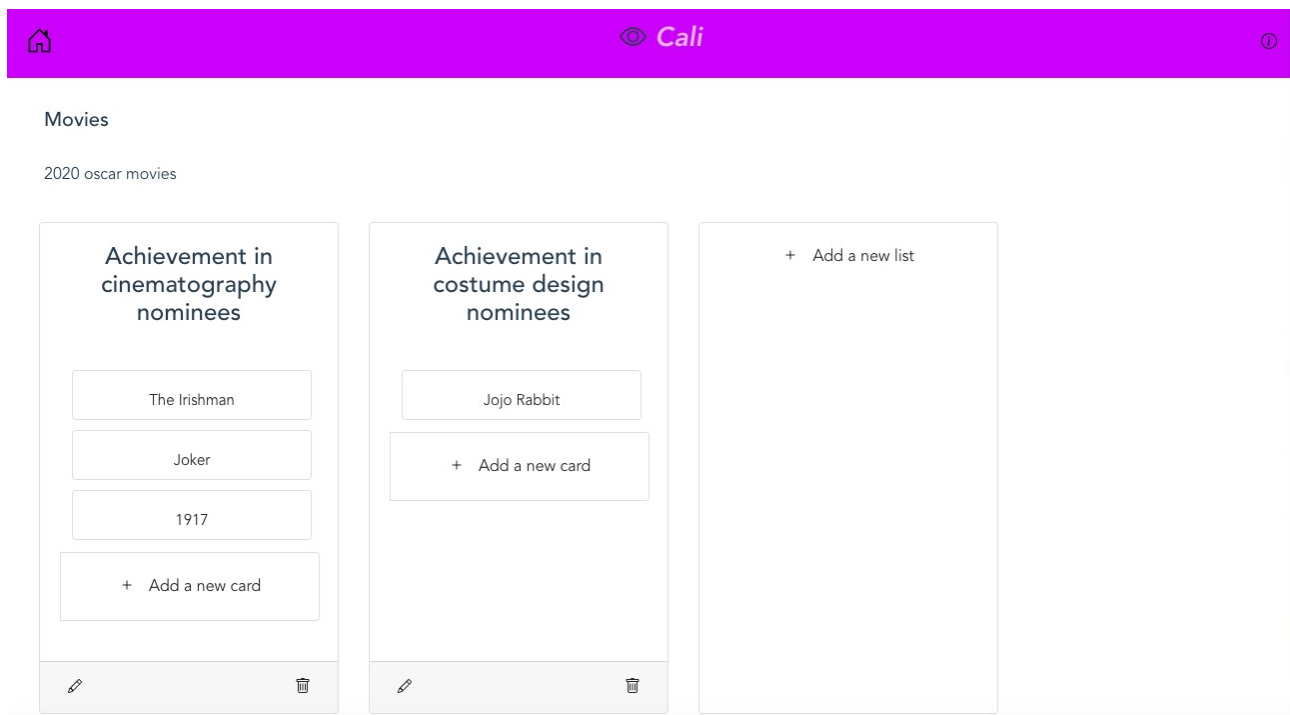

A new modal will appear. It will have the data auto completed with the board's data. The user will have to modify them and submit the information.

A modal window titled "Edit board" with a close button (X) in the top right corner. It contains two text input fields: "Title" (with the value "Movies") and "Description" (with the value "2020 oscar movies"). At the bottom right, there are two buttons: "Cancel" (gray) and "OK" (blue).

What is in a board?

By clicking a board, the user will be redirected to a page that shows its details.

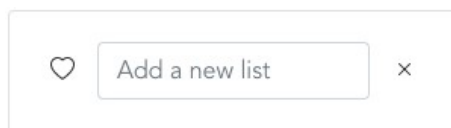

The information is organized in lists of cards.

By clicking on the “+ Add a new list”, the button will be replaced with an input-form and the user can add the new list's title.

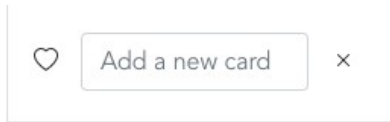

+ Add a new list

The user will be able to save the new list by clicking on the save button (heart icon), or to cancel the action by clicking on the X – button.

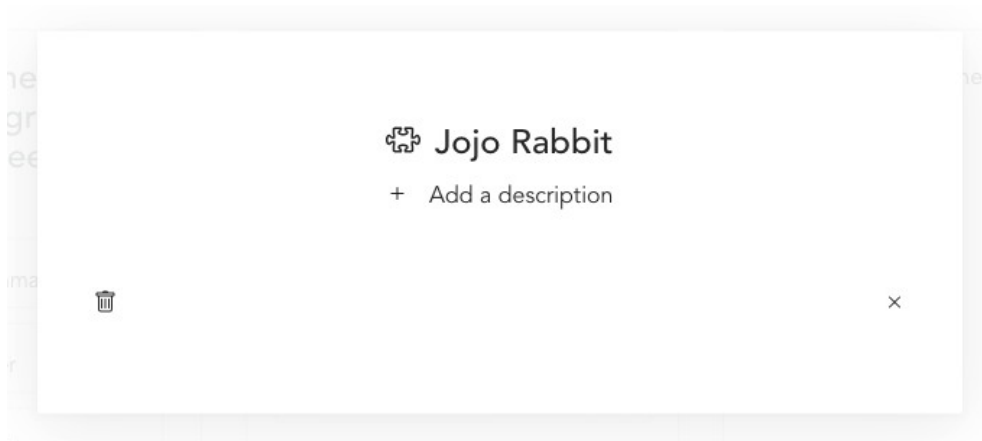

Each board has a delete button and an edit one. By clicking on the edit button, the user will be able to edit the name of the list.

Each list has its own cards displayed vertically. A new card can be added by clicking on the “+ Add a new card” button. The button will be replaced by a form that works just like the “add a new list functionality”.

The details of each card can be seen by clicking on them. A modal will pop-up, where the user will see the title and the description of the card.

The card can be deleted by clicking on the delete button. The modal can be closed by clicking on the x – button.

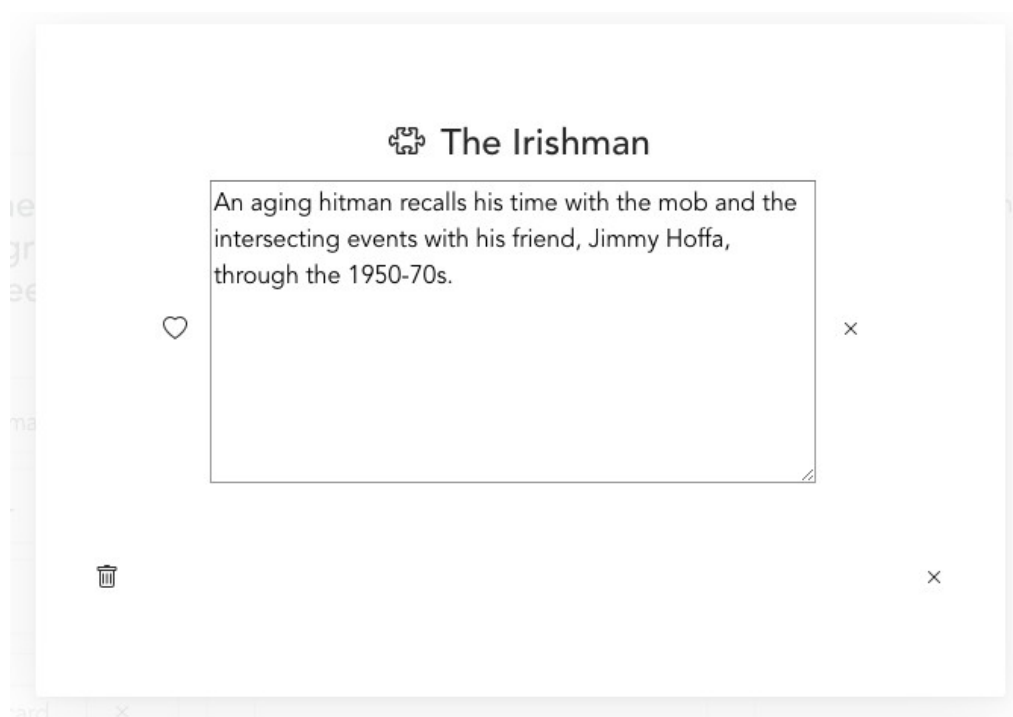

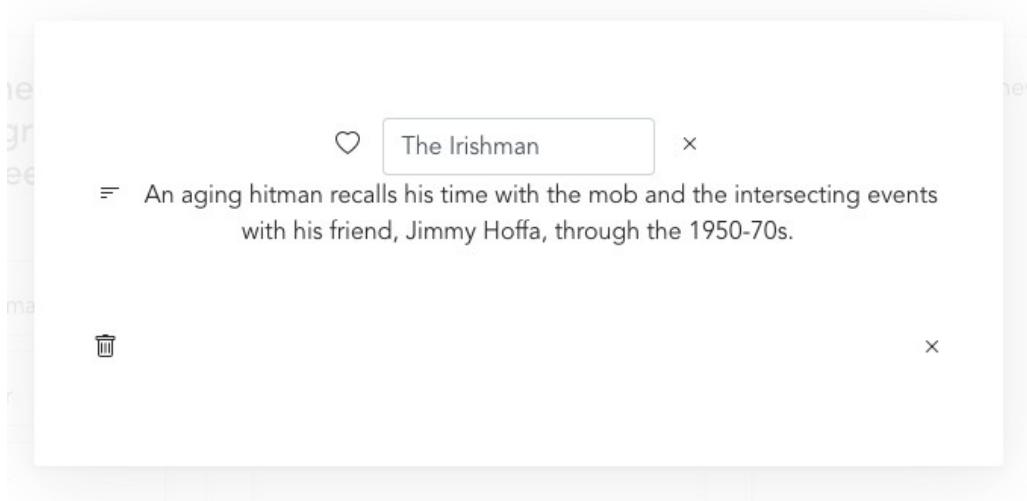

The user will be able to add a description to the card by clicking on the “+ Add a description” button and the button will be replaced by a form.

The user can save the description or cancel the action.

The title and the description can be edited by clicking on them, and they will be replaced with a form already autocompleted with the cards data. The user will just have to add his changes.

The user can save the changes or cancel the action.
